

FortiGate Deployment Scenarios on Microsoft Azure

December 2017

Fortinet Security Fabric - Extending to Azure Cloud

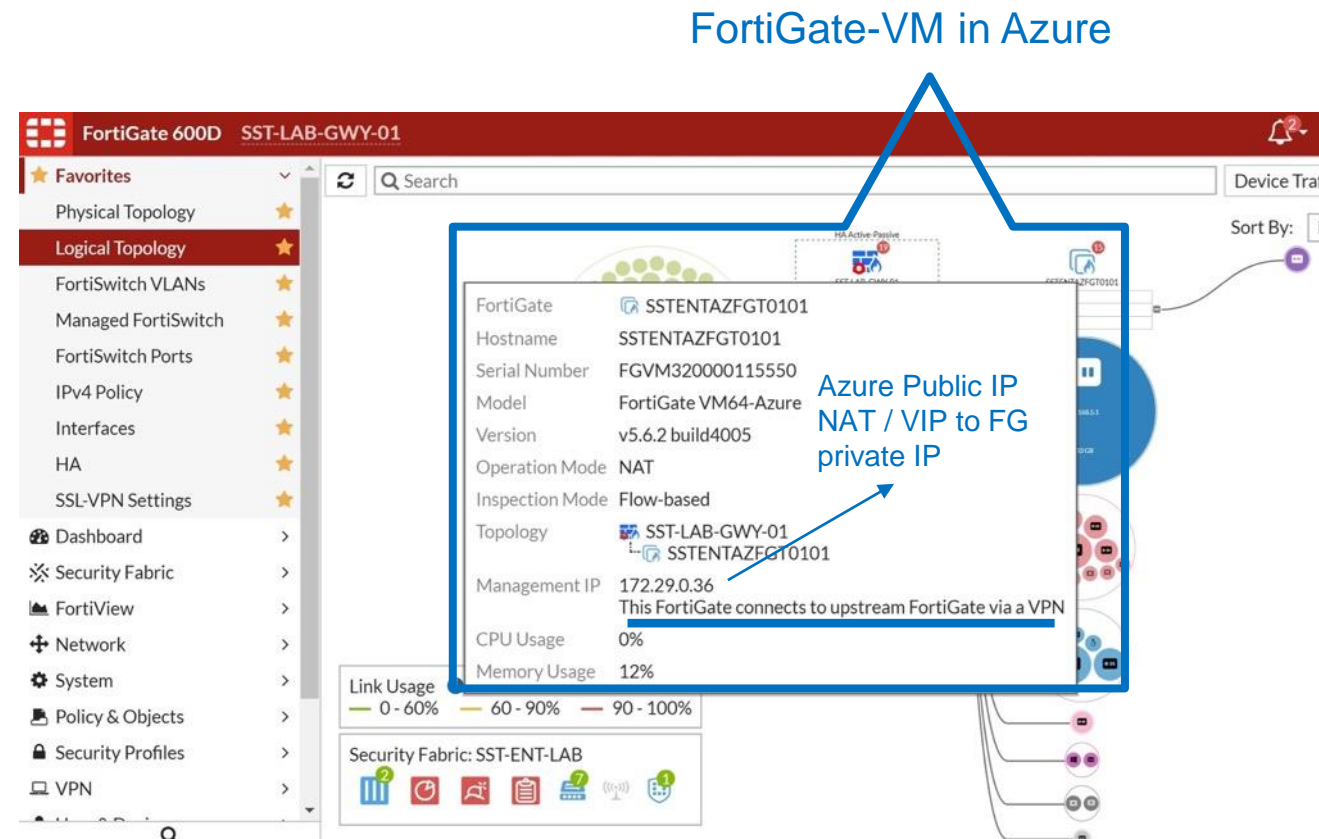

Cloud Security

Security Fabric in Action – FortiGate instance at Azure

Cloud Security

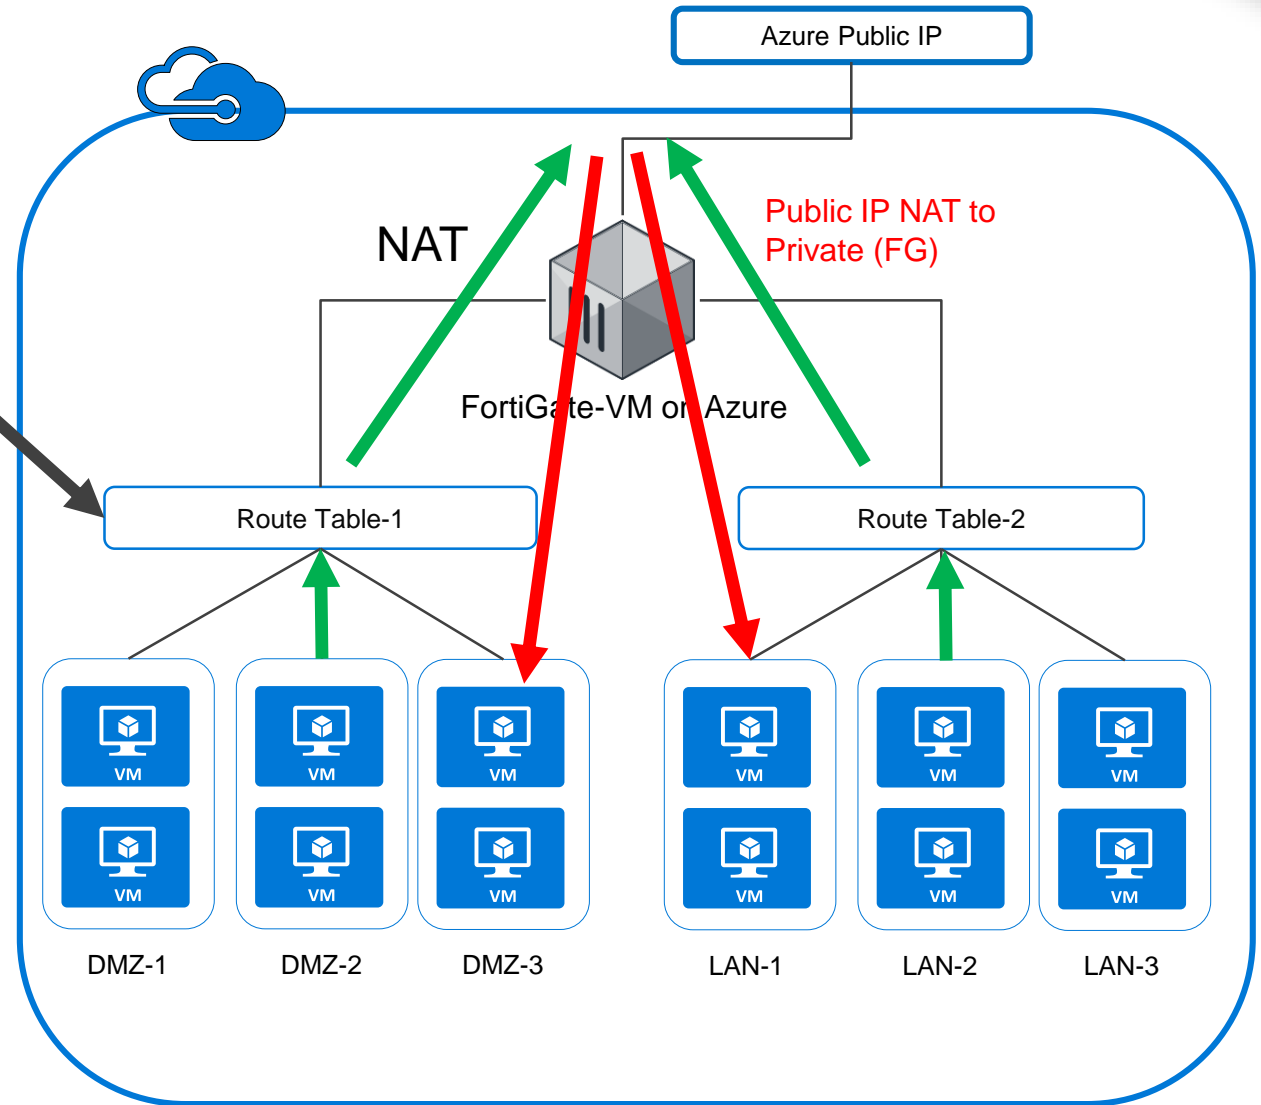

- Customer on-prem infrastructure *'extends' to cloud* via VPN
 - from on-prem FortiGate to FortiGate-VM in Azure Marketplace
- Features Supported including:
 - Fabric View
 - Fabric Audit
 - Consolidated logging
 - V-series licensing (no VDOMs)
 - Based on v5.6.2

Design Option 1 - Azure Simple Application hosting

Use Case : Application/DMZ Hosting

- Perimeter Firewalling
 - » **Inbound:** DNAT by Azure (**red**)
 - VIP on FG to allow services
 - SNAT on FG **optional**
 - » **Outbound:** Azure UDR/Route-table Mandatory
- Internal Segmentation
 - Traffic between DMZ/LAN via FG
 - Azure UDR/Route-table Mandatory
- Simple Deployment
 - » Single FG-VM
 - » No HA / Load balancing
 - » 99.9% Azure SLA (guaranteed by Azure)
- IPSec VPN Supported (1 to 1 NAT)
- Q: How about if FG-VM fails?
- A: Restore with backup config/license (or refer to HA design)

Design Option 2 – Cloud Hosting with HA

Use Case: Application/DMZ hosting with HA

High Availability

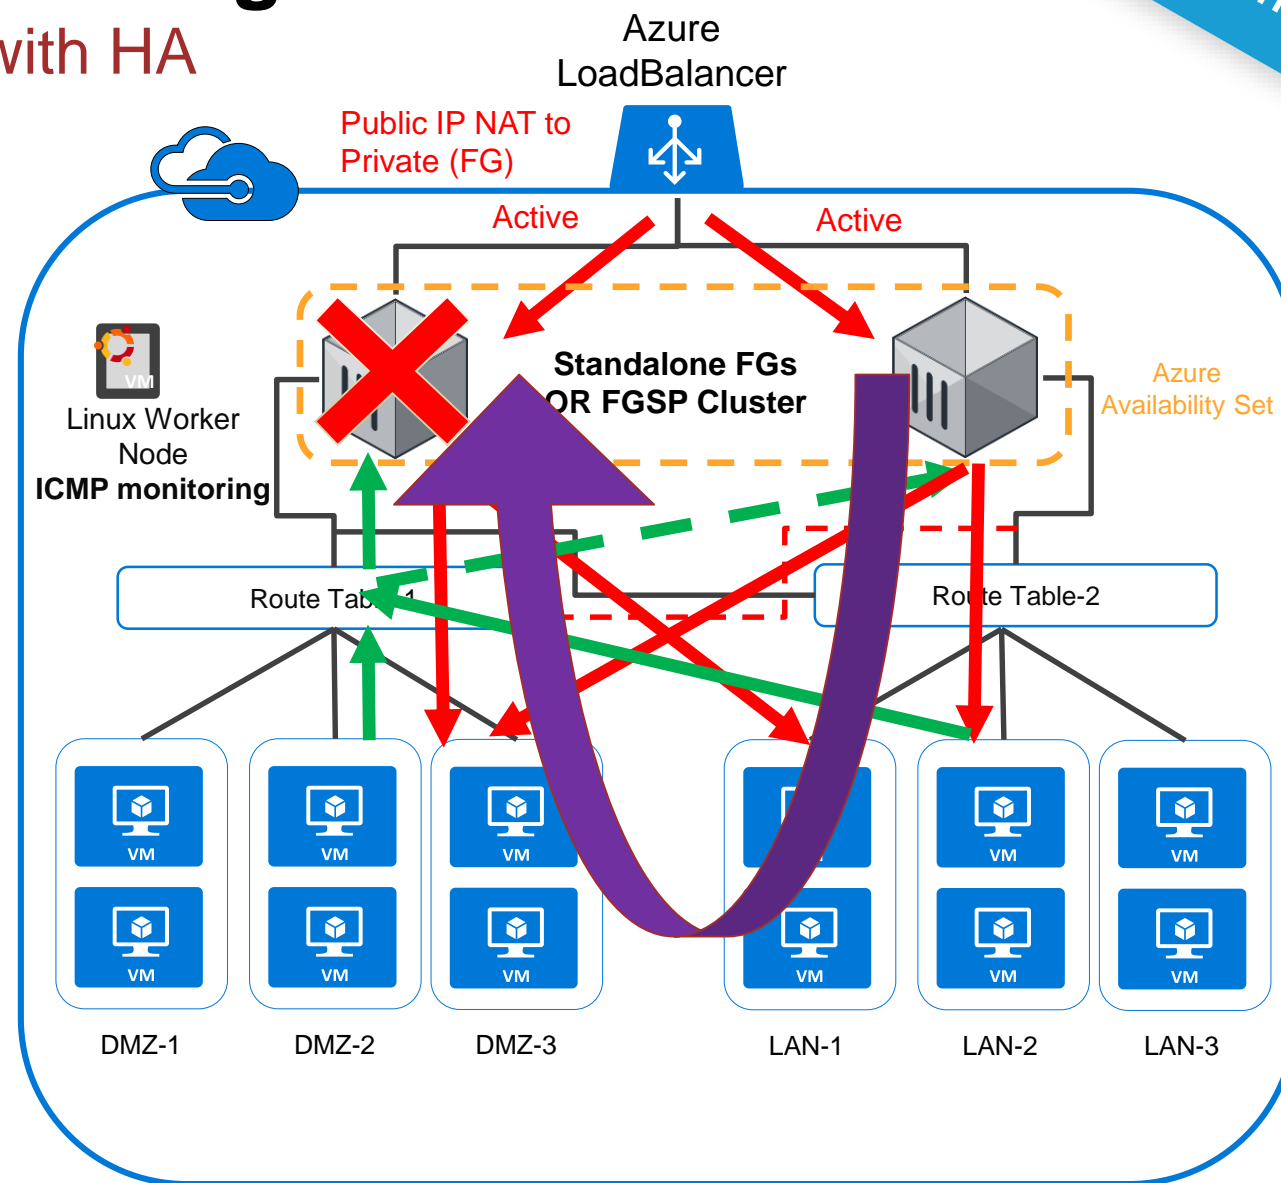

- » Inbound Active/Active (red)
- » Outbound Active/Standby (green)
 - DMZ/LAN default route to FG1 (left)
- » Achieved by:
 - Azure LB (in build HA)
 - Linux worker Node w/ ICMP monitoring (scripts provided by FUSE community)
- » 2 separate “Active” FG-VMs
- » No FGCP (traditional HA)
- » FortiManager to maintain configs between two FGs
- » No IPSEC VPN support (because of Azure LB)

Public Cloud HA

- » **Availability Set** Recommended (FG 1 & 2 on separate physical host/rack/power)
- » FGSP Supported with **Azure Direct Server Return** (no DNAT on Azure LB, inbound)
- » API call route-table swap/NHIP swap (Next Hop IP)

Q: Customer lose visibility with inbound SNAT by FG

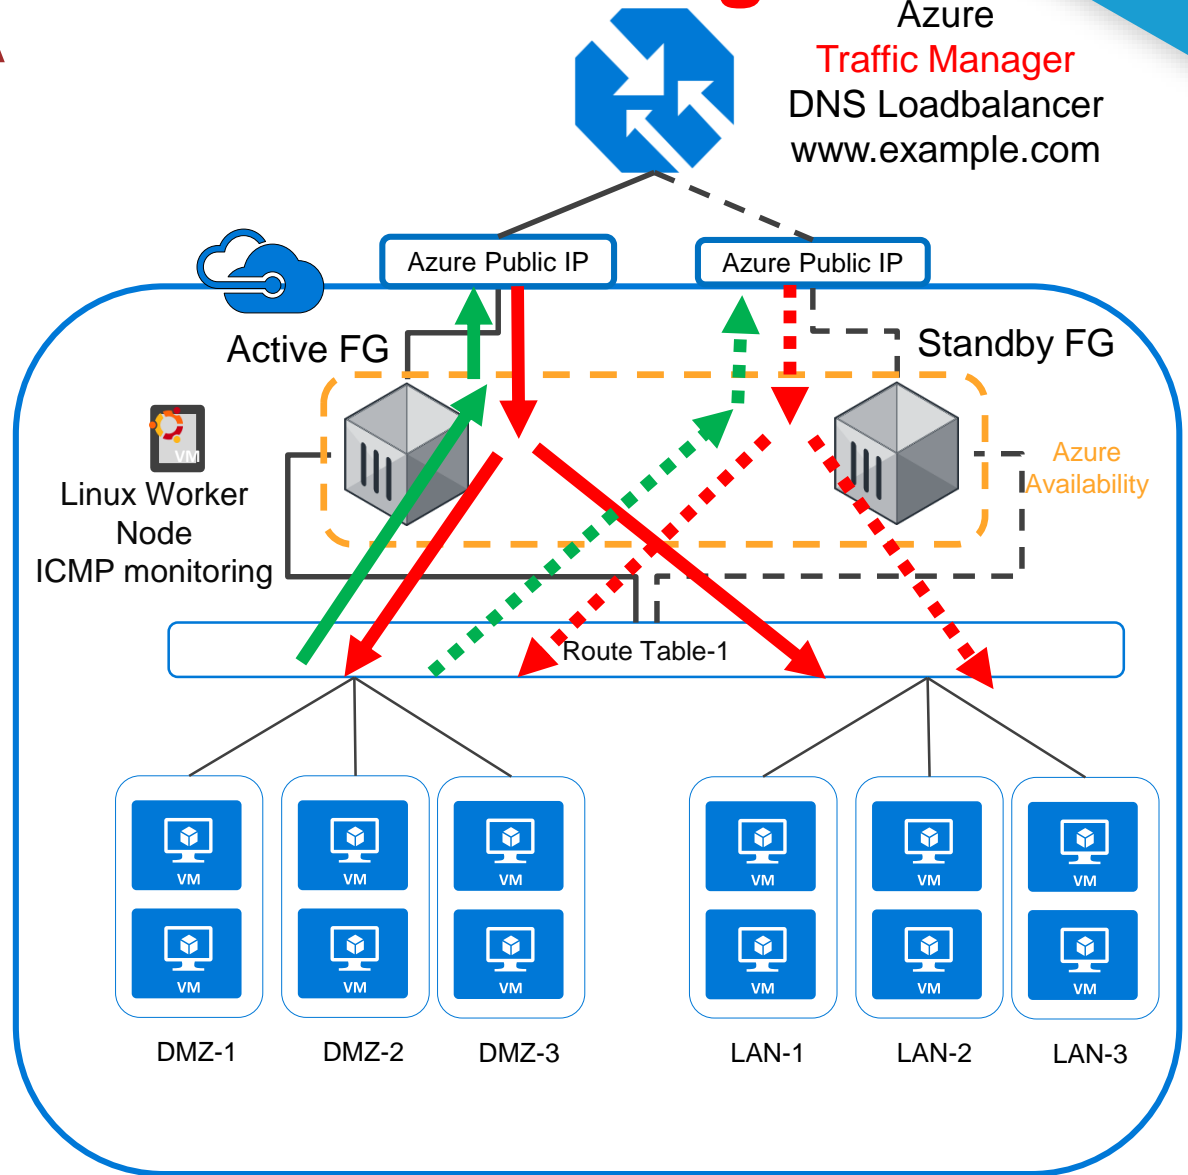

A: if no SNAT you can end up with **Asym routing**

Design Option 3 – HA with **Azure Traffic Manager**

Use Case: Active/Standby Bi-directional HA

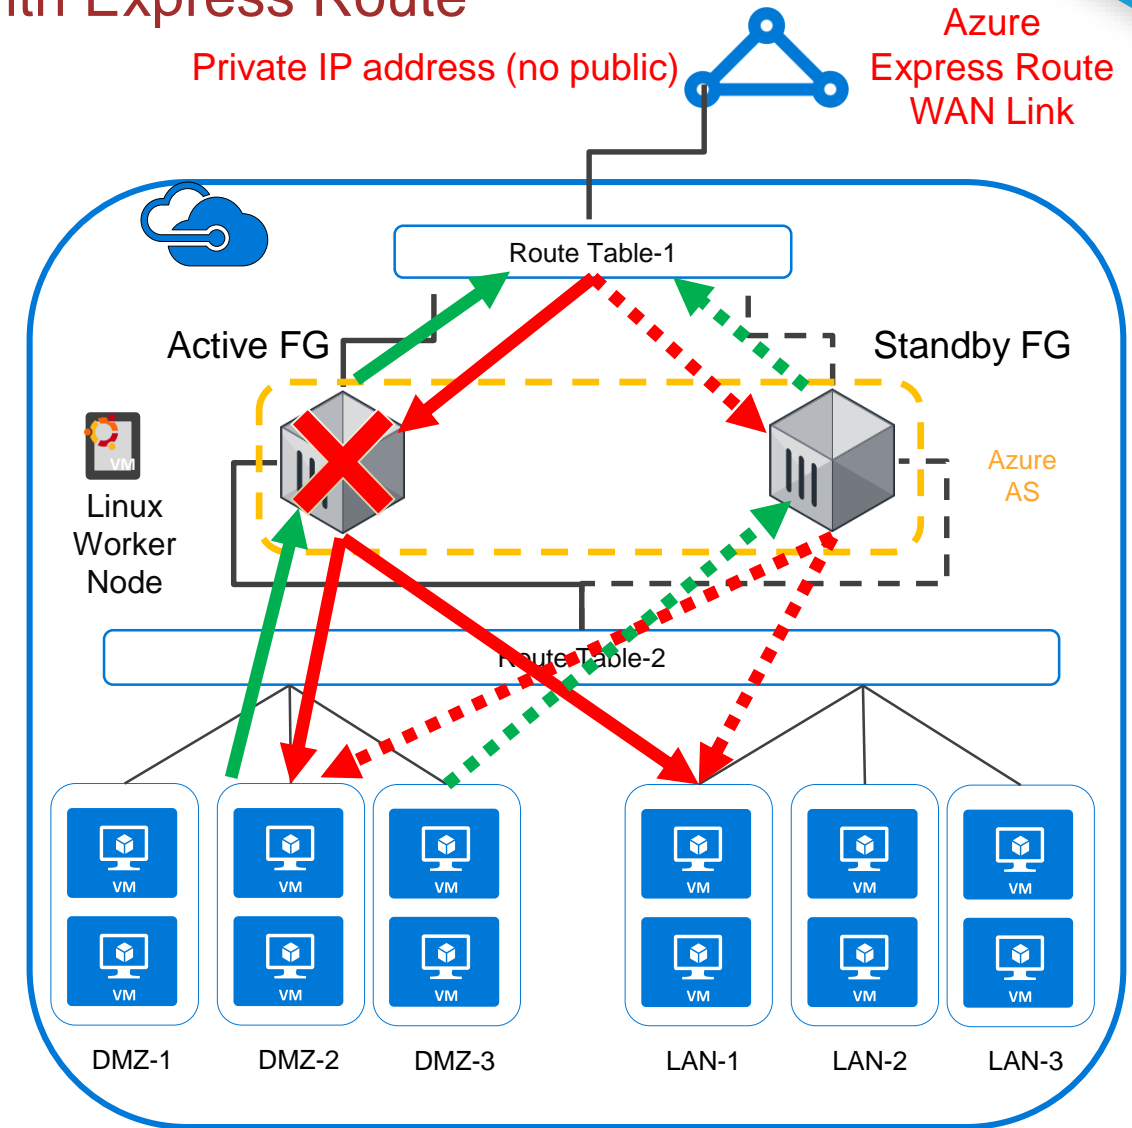

- Perimeter Firewalling
 - » DNAT by Azure (Inbound - **red**)
 - » SNAT on FGT optional (Outbound - **green**)
- Azure Traffic Manager
 - » Probe: ICMP, HTTP, frequency, etc
- Public Cloud HA
 - » Active/**Standby** (No FGCP)
 - » Linux VM / Container Controller
 - » **Availability Set** Recommended
- IPsec VPN Supported
- Q: When to use Azure TM?
- A: Avoid Asymmetric Route and when SNAT can't be used for return traffic.

Design Option 4 – HA with **Azure Express Route**

Use Case: Active/Standby Bi-directional HA with Express Route

- Azure Express Route
 - » Key: Route table(s) in front/behind FG
- Perimeter Firewalling
 - » No Nat required- Maximum visibility
 - » Inbound (**red**), Outbound (**green**)
 - » On-Prem Extension (Hybrid Cloud)
- Public Cloud HA
 - » Inbound/Outbound Active/Standby (No FGCP)
 - Only 1 NHIP from route table (can't sent to both FG), ie no ECMP support
 - » FGSP support
 - » Linux VM / Container Controller
 - » **Availability Set** Recommended
- IPSec VPN Supported
- Q: What is different to Option 3?
 - » A: Route table used at Gateway Subnet on Express Route

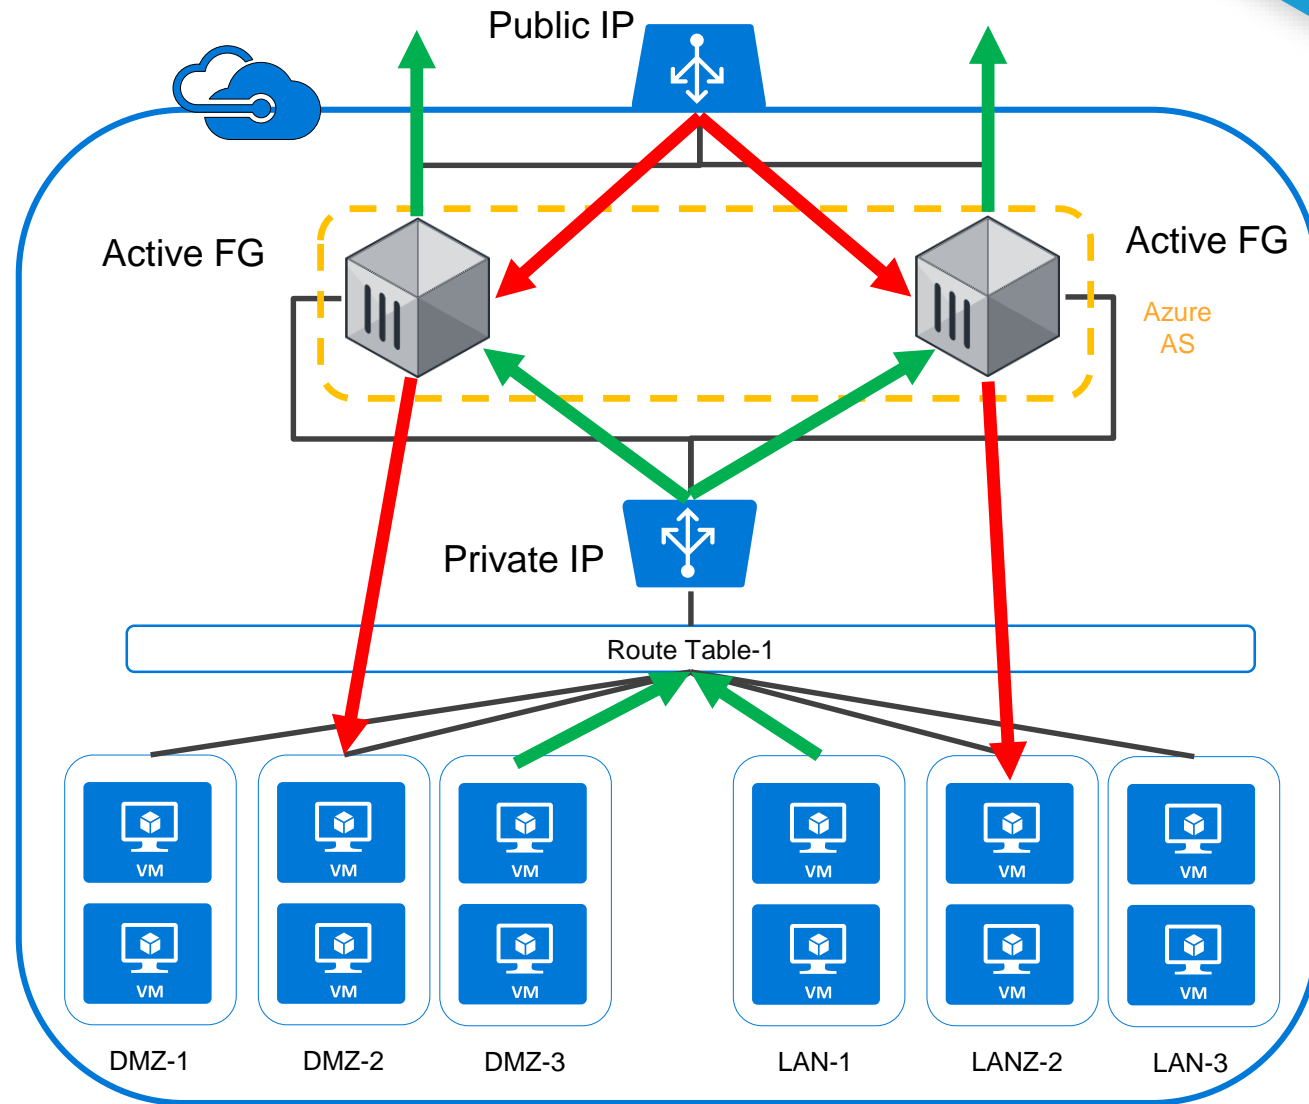

Design Option 5 – HA with **Azure Internal Load Balancer**

Use Case: Active/Active Bi-directional HA – Currently Under Preview

Cloud Security

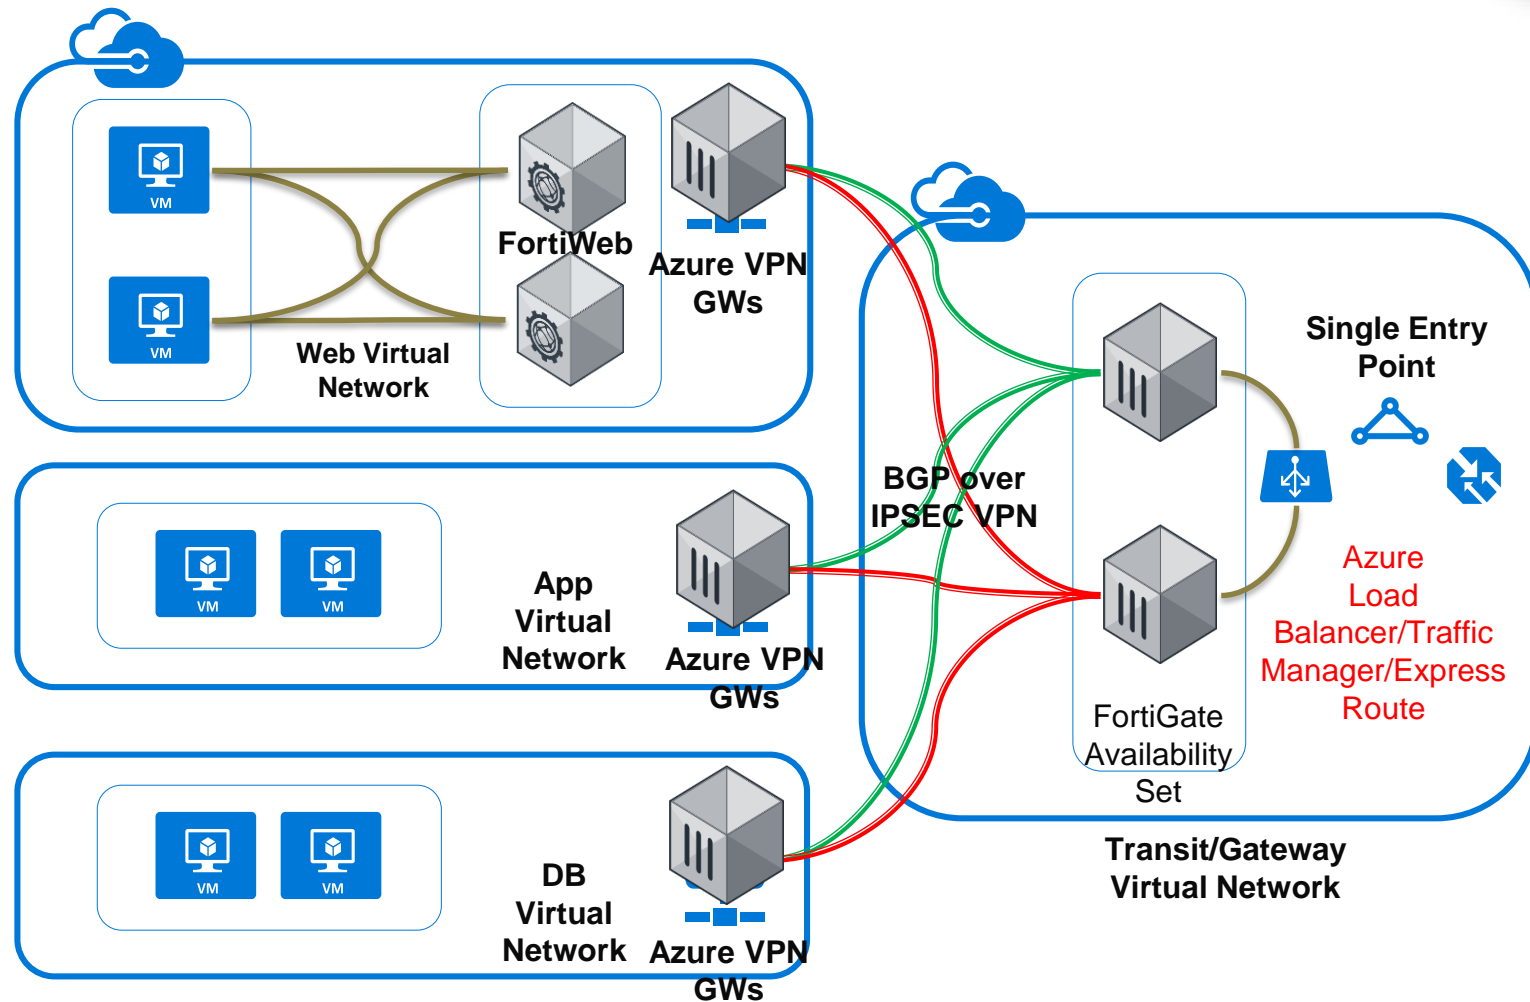

- Design under review from MS (not GA)
 - » Additional internal LB (bottom one)
- Perimeter Firewalling
 - » DNAT by “public” Azure LB
 - » SNAT on FGT (Avoid Asymmetric Route)
 - » NO SNAT - FGSP Works with Direct Server Return (no DNAT on Azure public LB)
 - » Internal LB – NHIP in one Route Table (vs 2 before, optional)
- Public Cloud HA
 - » **No Linux SDN controller (monitoring)**
 - » Inbound – Active/Active (**red**)
 - » Outbound – Active/Active (**green**)
 - » **Availability Set** Recommended
- IPSec VPN Not-Supported
- Q: Limitations?
 - » A: Only Works for TCP/UDP (**All Port rule under Preview**)

Design Option 6 – HA with **IPSEC+BGP Transit vNet**

Use Case: Hub and Spoke deployment, Large Enterprises

- Transit Gateway Vnet
 - » **Single Point of Entry into Azure Platform**
 - » **Vs multiple Entry Points with FG on each vNet**
 - » Auto traffic path failover with BGP
 - » HA based on BGP Over IPsec VPN
 - » Increases architecture complexity
 - » **IP NAT Pool For FGSP**
- Perimeter Security
 - » Reduces # of Azure FGT instances & cost by removing the requirement for 1 FortiGate per vNet, can have spoke vNet in different regions, E-W Traffic control
- Options:
 - » FG Active Standby or A-A
 - » Different VPN tunnel active by BGP routes (green only, green or some red)
 - » Failover, all red tunnels active
 - » Azure VPN GWs replaced by FG(s)
 - » Active/Active(Load-Sharing Optional)

Recommended Best Practices

- Secure Gateway vNet
 - » Minimum Entry points
 - » Enforce Security at Perimeter
- Availability Sets (Azure separate power, rack, compute)
- Sizing
 - » Price Performance combination
 - Stack VM04 and VM08
 - » Instance Level
 - » NIC Level
 - » VPC / vNet level
 - Dedicated Firewall
 - Perimeter vNet / VPC
 - Org Unit vNet / VPC

FG VM level	vNIC supported	Azure Instance	AWS Instance
01	2	D1, D1v2, F1, and F1s	m3.medium
02	2, 3(c4.large)	D2, D2v2, F2, and F2s	c4.large, m4.large
04	4	D3, D3v2, F4, and F4s	c4.xlarge, m4.xlarge
08	4	D4, D4v2, F8, and F8s	c4.2xlarge, m4.2xlarge
16	8	D5v2, F16, and F16s	c4.4xlarge,
32	8	D32v3, F16, and F16s	c3.8xlarge

The image features the FORTINET logo in white, bold, sans-serif capital letters. The logo is centered horizontally and slightly above the vertical midpoint. The background is a solid dark red color. Overlaid on this background are numerous white, semi-transparent hexagonal outlines of varying sizes and orientations. Some hexagons are nested within others, creating a sense of depth. There are also small white circles and thin white lines scattered across the background, suggesting a network or molecular structure. The overall aesthetic is technical and modern.
